Basic Authentication Filter

Scenario: Create a simple authentication filter that checks if a user is logged in before allowing access to protected pages.

Task:

1. Create a servlet filter named `AuthenticationFilter`
2. Configure it to intercept requests to `/secure/*` URLs
3. The filter should check for a session attribute named `user`
4. If `user` exists in session, allow the request to continue
5. If `user` doesn't exist, redirect to `/login.jsp`
6. Create a simple login servlet that sets the `user` session attribute
